

ROS-Industrial (Singapore, Asia Pacific)

# Developer's Meet

14<sup>th</sup> September 2021

## Level 1

### Intelligent Navigation

#### Basic modules

- **Level 1a** - Test scenario and test module: *I2R will contribute by constructing a 2-level of virtual world in gazebo with lift and curtains to be used for training test scenarios and practicing map switching*
- **Level 1b** - Modified amcl: *I2R will contribute by having more robust 2D localization in the presence of temporal large objects (e.g. curtains and doors)*
- **Level 1c** - Marker identification: *I2R will contribute on having docking marker identification in ROS2*

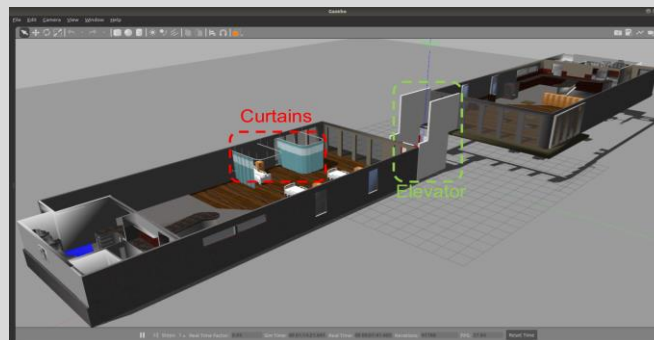

Existing amcl

Modified amcl

Outcome

## Level 2 & 3

### Intelligent Navigation

- Intelligent navigation with different sensor configuration and able to navigate in places in the presence of some crowd
- Accurate localization via sensor fusion
- Intelligent obstacle avoidance & path planning in crowded environment
- Able to react to code blue/red in hospital ward
- Able to move to different target pose(s) when the initial target pose is occupied
- People following
- Ability navigate towards the dynamic objects (e.g., bed, tables and etc.)
- Taking elevator (map switching)

# I2R's Navigation stack Implementation

---

I2R's Navigation Stack unique features:

1. Has been ported to multiple types of robots for both indoor and outdoor applications.
2. Single framework supporting both 2D and 3D lidar.
3. Able to navigate in the presence of crowd.
4. Exhibit various intelligent navigation routine behavior including giving way to wheelchair.
5. Able to response to events at public spaces. (e.g. emergency situation of code blue, red, kept to predefined side, able to decide of appropriate path based on task urgency etc).
6. Integrated with visual analytics allowing robot to move to appropriate location (eg table, trolley, bed, people etc) when the goal position has changed
7. Compatible with RMF (Robot Middleware Framework).

# Final release of Level 1A module

- Developed two-level virtual world with the elevator and curtains in Gazebo ([Link](https://gitlab.com/nurskz/two_level_gazebo_world))

### Two Level Gazebo World

pipeline

passed

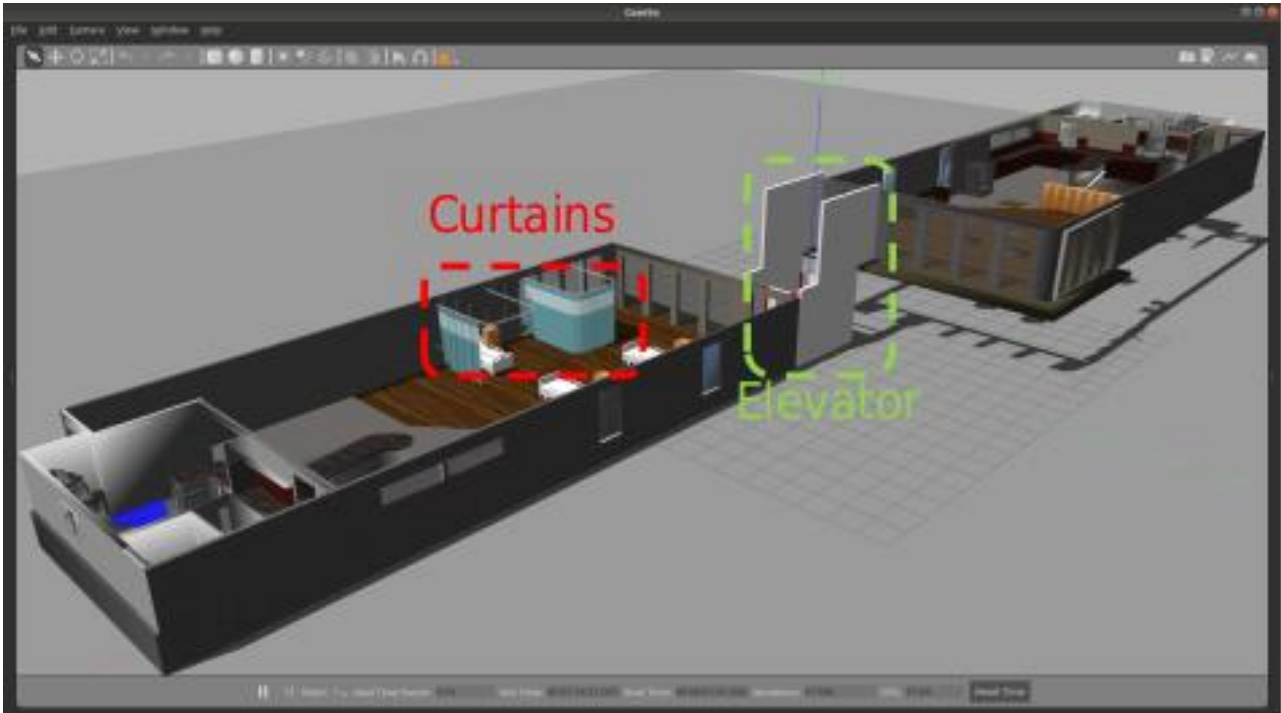

License

Apache 2.0

#### What is this?

This package is the two-level virtual world with the lift and hospital curtains developed for Gazebo simulator.

- Allows multi robot systems to work under one roof / shelter
- RMF enables the robot to interact with doors and lifts automatically
- The core system takes care of allocation tasks, traffic management, etc. Adapters can connect to different parts of the infrastructure.
- RMF simplifies / standardizes messages. It is a system of systems synthesizer, allowing different systems to talk in different protocols; plugins translate between protocols. Also provides standard messages.
- RMF can resolve unexpected conflicts in a dynamic environment.
- The RMF toolbox includes:
  - Traffic editor: annotate floor plans
  - Building map tools
  - Testing; able to use Ignition Robotics 5 models
  - rmf\_core provides integration with rmf
- Use the operations dashboard for monitoring schedules and trajectories. The dashboard is migrating from rviz (foxy release) to web-based (build from source).

# RMF , Standalone Package (Video)

---

# Final release of Level 1B module

- The existing AMCL localization package is modified to be more robust to large scene changes caused by temporal, but predictable objects (e.g., curtains & doors) [Link](https://gitlab.com/nurskz/modified_amcl)

Name	Last commit	Last update

### Modified AMCL package

pipeline passed

#### What is this?

This package is the modified version of existing AMCL localization package to be more robust to large scene changes caused by temporal, but predictable objects (e.g., curtains, opened/closed doors).

## Aruco\_Ros2

=====

pipeline passed License BSD 2-Clause codecov unknown

Software package and ROS2 wrappers of the [Aruco](#) Augmented Reality marker detector library.

### Features

# Marker Identification

A fiducial marker or fiducial is an object placed in the field of view of an imaging system that appears in the image produced, for use as a point of reference or a measure.

Ruler used as a Fiducial marker

Adoption steps by industry partners (typically non-end user, but system integrator or robotics service provider):

1. Discussion of the needs and project scoping.
2. Training of engineer staff on the use of I2R's navigation stack.
3. Integration into required platform or software, if any, to realize a prototype robot.
4. Evaluation and testing, including on site.
5. Deployment and commercialization by industry partner.
6. Feedback by partner and further upgrade by I2R
